Supported tools and boundaries

Phase 2 tools are read-only server functions. The LLM can request only tools registered by the app. The server validates every name and argument and checks the logged-in user's ERPNext permission before reading data. Tools do not create, update, submit, cancel, or delete documents.

User-facing capability	Data returned	Requirements and limits
Find an item	Up to five matching item codes and names	The user must have read access to Items. Ambiguous matches should be clarified before querying a balance.
Check stock balance	Current on-hand quantity and unit of measure; optional warehouse filter	Requires read access to Item and Bin; Warehouse read access is also checked if a warehouse is specified. Without a warehouse, the app sums visible Bin quantities across warehouses, subject to a result cap.
Find overdue invoices	Count, outstanding totals grouped by currency, and oldest due date	Supports submitted Sales Invoices or Purchase Invoices with ERPNext status `Overdue` and a positive outstanding amount. Requires read permission on the selected invoice DocType. Hosted mode sends aggregates, not invoice-level rows, to the model.
Summarize sales	Submitted Sales Invoice count and base-currency total for an exact date range	Uses the logged-in user's default Company, when configured, and Sales Invoice read permission. The total uses ERPNext's base grand total.
Read Profit and Loss	Summary metrics from ERPNext's built-in Profit and Loss Statement for an exact date range	Uses the logged-in user's default Company and ERPNext's report implementation. `get_report_data` is allow-listed to this report only; arbitrary report execution is not supported.

The Python registry currently contains `search_items`, `get_stock_balance`, `get_overdue_invoices`, `get_sales_summary`, `get_profit_summary`, and `get_report_data`. The last two both read the built-in Profit and Loss Statement through the app's report adapter.

Business-data modes

- Disabled: no Phase 2 business-data answers.
- Local LLM only: tools are allowed only with the configured OpenAI-compatible local endpoint.
- Hosted LLM, aggregated results only: requires explicit System Manager consent. Compact results are passed to the hosted provider so it can summarize them.

Tools must also be enabled. Provider setup is documented in LLM setup.

Not currently supported

- Employee leave balances, absence lists, employee payroll or salary information.
- Generic reports or arbitrary database questions.
- Record creation or changes, including quotations, invoices, stock adjustments, and payments.
- General-purpose questions outside ERPNext.

For unsupported requests, the assistant should explain the limitation or redirect to ERPNext support. It must not invent values or imply that it changed a record.
